Education

Kyushu University

Apr 2026 – Present

M.S. in Information Science and Electrical Engineering
Research Focus: CFD, HPC, LLM

Beijing Normal University, Zhuhai

Sep 2020 – Jun 2024

B.S. in Software Engineering

GPA: 3.5/4.0

Honors & Awards

Second-Class Scholarship, Software Engineering Program, Beijing Normal University, Zhuhai *2021 – 2022*

Outstanding Student Union Cadre, School of Information Technology, Beijing Normal University, Zhuhai *Oct 2022*

Second Prize, 14th Lanqiao Cup Guangdong Provincial C++ Programming Contest (University Group A) *Apr 2023*

Bronze Prize, China Collegiate Programming Contest – Guangdong Provincial Contest (CCPC Guangdong) *May 2023*

Work Experience

GADE UNION

Full Stack Developer

Singapore

- Joined as a Full Stack Developer at GADE UNION, a Singapore-based company, contributing to full-stack development across both frontend and backend systems.

Projects & Research Experience

SkyEats – Multi-Module Food Delivery Platform

Sep 2025 – Oct 2025

Backend Developer

- Built a food delivery platform with Spring Boot, MyBatis, Redis, and MySQL, covering user ordering flows and merchant-side dish, set meal, and employee management.
- Optimized dish and set meal caching with Redis to reduce database pressure under high concurrency, while supporting full order placement and simulated WeChat Pay.
- Integrated WebSocket for order alerts and customer reminders, and used ECharts and Apache POI for business dashboards and report exports.

LifeSelect

Oct 2025 – Nov 2025

Backend Developer

- Developed a Spring Boot-based merchant review platform with SMS login, merchant search, flash-sale coupons, blogging, follow relationships, and feed-stream delivery.
- Leveraged Redis for shared sessions, caching optimization, distributed locks, and asynchronous message queues to improve performance and concurrency handling.
- Implemented asynchronous flash-sale ordering with Redis Stream, and built check-ins, UV statistics, and nearby merchant search using BitMap, HyperLogLog, and GEO.

Gitlet

Nov 2025 – Dec 2025

Developer for Core Version Control Features and Remote Commands

- Implemented a simplified Git version control system in Java, supporting core commands such as init, add, commit, log, branch, and merge.
- Built SHA-1 content-addressed object storage with file-system persistence for blobs, commits, branch pointers, and staging states.
- Implemented branch switching, recursive merging, conflict handling, and remote operations including push, fetch, and pull for basic distributed workflows.

LLM Forge

Jan 2026 – Apr 2026

End-to-End Developer

- Built a GPT-like large language model from scratch, covering data preprocessing, pretraining, evaluation, fine-tuning, and inference.
- Implemented a decoder-only Transformer in PyTorch, including attention mechanisms, positional encoding, and multi-layer Transformer blocks.
- Developed reusable data pipelines for text cleaning, tokenization, sequence sampling, and batch processing, along with an autoregressive pretraining loop.
- Evaluated and optimized the model using perplexity and generation quality, and fine-tuned it for text classification and personal assistant applications.

PatientFlow Cloud

Apr 2026 – May 2026

Backend Developer

- Built a production-grade healthcare management platform using Java Spring Boot microservices, covering patient management, billing, analytics, and authentication.
- Designed distributed service communication with gRPC for synchronous requests and Kafka for event-driven asynchronous messaging.
- Implemented secure access control using JWT, with an API Gateway for unified routing, traffic entry, and service access management.
- Containerized services with Docker and deployed the system to AWS ECS using CloudFormation for automated infrastructure provisioning.
- Added unit tests, integration tests, and OpenAPI documentation to improve reliability, maintainability, and developer onboarding.

Starry-Eyes —Interactive 3D Art Piece

May 2026 – Jun 2026

Creative Front-End Developer

- Built an interactive WebGL experience with Three.js and Vite that recreates an oil painting in 3D, mapping a full PBR texture set (albedo, normal, roughness, metalness, emissive, displacement) onto a 256x256 subdivided plane so brush strokes physically displace the geometry.
- Engineered a real-time post-processing pipeline (bloom, vignette, film-grain dithering, ACES tone mapping) and an audio-reactive layer that drives a two-layer starfield and bloom intensity off a live Web Audio FFT spectrum.
- Implemented a cinematic camera system: a Catmull-Rom fly-in with eased motion, model-trailing camera, and a state-machine handling timed fade-in/dissolve of glTF models, particle bursts, and a constrained idle-breathing orbit control.
- Secured premium media behind a server-side riddle gate using a Vercel serverless function and Edge Middleware, with stateless HMAC-SHA256 signed session cookies (Web Crypto) verified across runtimes; assets stay 403 without a valid session.

- Optimized delivery with build-time WebP texture conversion, anisotropic filtering, PMREM environment pre-filtering, font subsetting to a tiny woff2, device-aware pixel-ratio caps, and automated production deploys to Vercel.

Skills

- Languages: JavaScript/TypeScript, Java, Python, Shell, C/C++
- Frontend: React, Vue, Next.js, Tailwind CSS, Bootstrap
- Backend: Spring Boot, Spring Cloud, NodeJs
- Databases & Middleware: MySQL, Redis, MongoDB
- AI/ML: PyTorch, TensorFlow, NumPy, Pandas, scikit-learn, Matplotlib
- Tools & Systems: Linux

Additional Information

- English Proficiency: CET-4, CET-6, TOEFL 83
